Abstract
In-depth research on the use of technology in English language training from 2018 to 2024 is done in this complete systematic review of the literature. It explores how a wide range of digital tools are changing pedagogical methods and highlights the significance of continued professional growth and assistance. The study features the necessity for strategic implementation in line with pedagogical aims to maximize the influence of technology integration on language learning outcomes by integrating previous research and revealing insights into various approaches to technology integration. The results emphasize a general tendency in favor of digital integration, particularly for preservice teachers. In addition, this research also highlights issues revealing educators' differing degrees of familiarity with technology and the scarcity of resources. In this regard, there is an urgency in the inclusivity of digital language literacy exposure and training whether it can elevate English language teachers’ technology integration.

Keywords: English Instruction, Language, Learning, Teaching, Technology

1. INTRODUCTION

The use of technology in the classroom has become essential in the current digital era, not merely a trend (Budianto, 2020). There are many ways that technology can change the way we teach and learn, especially when it comes to language learning. With English being one of the most in-demand skills worldwide, there has been a noticeable movement in English language instruction toward technology-enhanced approaches (Pratiwi et al, 2023). There is a huge and constantly growing library of digital resources accessible for English language training, ranging from immersive language learning apps to virtual reality simulations (Mavili & Kartal, 2022). They said, in similar way, the majority of technology integration initiatives appear to offer little more than an extra layer of functionality, such as the ability to play online vocabulary games or show information electronically, with minimal connection to the learning objectives.

This review was motivated by the realization that technology can revolutionize language instruction. Teachers now must adjust their teaching techniques to meet the changing requirements of students considering the emergence of digital natives and the growing globalization of communication. Technology such as the internet, computers, multimedia devices, smart boards, LCDs, sound systems, amplifiers, and communication tools are frequently found in language classrooms today (American Council on the Teaching of Foreign Languages, 2018). These tools are used to support and improve the learning process (Richard, 2015). English language learners can experience new things that they would not find in
traditional education because of the abundance of elements that technology offers on educational menus (Eady & Lockyer, 2013). Therefore, curriculum developers, educators, and legislators need to comprehend the dynamics of technology integration in English language instruction.

In the current educational environment, one of the most important ways to promote rich learning experiences is through the easy incorporation of technology into English language training. Adopting cutting-edge tech tools improves language instruction's effectiveness while also creating a dynamic learning environment that encourages individualized student engagement and quicker language acquisition. However, integrating technology into the classroom can be difficult for teachers, necessitating further support and professional development. The significance of this topic lies in the fact that it impacts curriculum writers, educators, and lawmakers. To improve the quality of language teaching and make informed decisions, these stakeholders must comprehend the dynamics of technology integration in English language training. Therefore, there is a need for studies that explore the following research questions: What does it mean to integrate technology into teaching English language skills and what aspects of technological integration could make learning English easier? And how important is it that digital resources and technology-enabled assessment incorporate technology?

Furthermore, the goal of this comprehensive study of the literature is to go deeply into the field of integrating technology into English language training. It aims to offer a thorough examination of previous research, illuminating the different approaches taken, the kinds of technology used, and the results found. Through the synthesis of results from a wide range of empirical investigations, this study aims to provide insightful information about the benefits and practical applications of technology-enhanced language learning.

2. METHOD
The technique used in this study included several crucial actions to guarantee a thorough and exacting analysis of the data that was available. Initially, a comprehensive search was carried out using predefined search terms linked to technology integration in English language instruction across electronic resources like ERIC, Google Scholar, and Web of Science. Systematic literature review is conducted systematically in the last 6 years to guarantee current and pertinent material particularly in the area of education, for research in technology use has rapidly disseminated during this time. The way language is taught has evolved due to new tools and approaches, which has prompted educators to experiment with new tech applications. Schools have been incorporating more technology into their curriculum from 2018 until 2024. We can better understand how technology has been employed in English language instruction by looking at research from this era. The articles were then subjected to a rigorous screening procedure that focused on providing findings on student learning or instructional methods linked to technology integration in English language training. After the final selection of publications, relevant data was extracted using a methodical process.

This study used a Systematic Literature Review (SLR) methodology. A research process known as a systematic literature review (SLR) finds, assesses, and interprets all of the literature that is pertinent to a certain research question, topic area, or phenomenon of interest (Kitchenham & Charters, 2007). This SLR's methodology looked into how different areas of academic writing training might use technology integration.
The present investigation adhered to the five protocols organized by Khan et al. (2003) for carrying out a methodical literature review, which are elaborated below.

**Step 1:** Specifying the Review Question.
According to Khan et al., (2003), the research issue for a systematic review needs to be clearly stated and specified. Prior to beginning the review, the problem needs to be identified and arranged in the question. To ensure a comprehensive scope, three research inquiries have been formulated: (1) What does it mean to integrate technology into teaching English language skills and what aspects of technological integration could make learning English easier? (2) How important is it that digital resources and technology-enabled assessment incorporate technology?

**Step 2:** Identifying relevant work.
According to Khan et al., (2003), defining the inclusion and exclusion criteria is necessary. Only journal articles released between 2018 and 2024 were taken into consideration for this review. Additionally, for this review, the researchers only took into account journal papers that were published online in a trustworthy database. Google Scholar is one of the search engines that was selected. Twenty articles were selected after a thorough screening procedure in compliance with the selection criteria. The following table displays the inclusion and exclusion criteria.

<table>
<thead>
<tr>
<th>INCLUSION CRITERIA</th>
<th>EXCLUSION CRITERIA</th>
</tr>
</thead>
<tbody>
<tr>
<td>● The publication dates of the articles were restricted to the period from 2018 to 2024.</td>
<td>● Any publications before the year 2018.</td>
</tr>
<tr>
<td>● Written in the English language.</td>
<td>● Literature Review Papers.</td>
</tr>
<tr>
<td>● The articles needed to contain the term “technology integration” and “technology integration in English language” in the title, abstract, or keywords.</td>
<td>● Publications that were not written in the English language.</td>
</tr>
<tr>
<td>● Accessibility in the form of openly accessible complete texts.</td>
<td></td>
</tr>
<tr>
<td>● Publication in peer-reviewed journals or relevant conference papers.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 3:** Evaluate the quality of the chosen resources.
The articles that were chosen for review were assessed according to the standards set out in Step 2 and their correspondence with the review questions.

**Step 4:** Summarizing the evidence.
Following a review of the selected articles, a table summarizing each article's findings was created.

**Step 5:** Interpreting the findings.
The review questions were taken into consideration when analyzing the results from the selected papers. The analysis was then applied to arrive at a conclusion.

### 3. RESULTS AND DISCUSSION
In this effort, 20 carefully chosen and examined article was thoroughly analyzed. The focus of these journals and articles, which span the years 2018 through 2024, is the technology employed in the English language instruction division. An easy approach to rapidly evaluate the key findings and lessons from each article is to look through the table below.
<table>
<thead>
<tr>
<th>No</th>
<th>Author(s) and Year</th>
<th>Journal/Vol/PP</th>
<th>Findings</th>

3.1. Technology Integration into English Language Instruction

As the globe becomes more interconnected, technology enables us to access increasingly advanced knowledge, science, and information, which may then be used to improve teaching and learning (Zhao, 2015; Nasrullah et al., 2023). In investigating the integration of technology into English language instruction, it becomes evident that a diverse array of digital tools, including mobile apps, virtual reality simulations, and online learning platforms, are reshaping pedagogical practices. This systematic literature review sheds light on how educators are leveraging technology to enhance language instruction, emphasizing the importance of ongoing professional development and support to effectively integrate digital tools into ELT practices. By synthesizing existing research, this study provides insights into the varied approaches to technology integration and underscores the need for strategic implementation aligned with pedagogical goals to maximize its impact on language learning outcomes.

Since children can become more interested in and engaged with the lessons being taught by using technological tools, as well as the possibility that they will learn more quickly and improve their communication skills, there is a general trend in favor of integrating technology into classes for younger learners (Taghizadeh & Hasani Yourdshahi, 2020). Language learners in the twenty-first century have greatly benefited from the introduction of smartphones, tablets, and numerous other advanced devices and electronic platforms (Al-Kadi, 2018). Along with discussing the ramifications of encouraging creativity and efficacy in teaching, it also demonstrates that teachers have critical views toward the integration of technology (Liang, 2021; Nasrullah, 2021; Rusmanayanti & Nasrullah, 2020). To avoid feeling inadequate in their professional lives, educators should stay current and renew their expertise (Furkan, 2020). If the goal is to employ technological integration to teach English to non-native speakers, then the curriculum and textbooks should make this clear, and the activities should be structured accordingly. (Şahin & Başar, 2022).

The discussion on the incorporation of technology in English language education underscores the revolutionary capacity of digital instruments to revolutionize pedagogical methodologies. With the rapid advancement of technology, educators can improve language instruction and learning outcomes by utilizing a wide range of digital tools, such as virtual reality simulations, smartphone apps, and online learning platforms. The use of technology in the classroom can raise students’ interest and engagement, which can speed up learning and improve their communication skills, especially for younger students. Nonetheless, teachers must always be updating their knowledge and making sure that the use of technology is in line with curriculum objectives and pedagogical aims. Despite the advantages, some educators have negative opinions about the use of technology in the classroom. This emphasizes the significance of addressing these
concerns and offering continued professional development and assistance to enable successful adoption. Through appropriate planned lesson, teachers professional development are strengthened (Basori, 2023). All things considered, the strategic integration of technology into English language instruction has the potential to create dynamic and productive learning environments; nevertheless, to fully realize this potential, careful planning, training, and alignment with educational objectives are necessary.

3.2. Technology Integration in Facilitating English Language Learning

Through a comprehensive examination of the literature, this systematic review delves into the effectiveness of technology integration in facilitating English language learning. By exploring the role of digital tools in improving language proficiency, motivating students, and fostering cultural awareness, this study highlights the transformative potential of technology in language instruction. Sometimes students focus too much on learning how to use technology rather than using it to further their education (Liang, 2021). Furthermore, it underscores the importance of internet accessibility and comprehensive training for educators and learners alike to harness the full benefits of technology integration in the language learning process. By synthesizing empirical evidence and theoretical frameworks, this review offers valuable insights into best practices for integrating technology into English language instruction to enhance student engagement and promote linguistic competence.

Most students lack a clear understanding of the different types of smart technologies, and each student has unique needs, requirements, and learning styles, according to a study designed to gain insight into a bachelor's understanding of smart technologies for learning a foreign language (Elsakova et al., 2019; Fauziah & Nasrullah, 2023; Nasrullah, Sari, et al., 2023; Rosalina et al., 2020). The goal of this course is to improve pre-service teachers' ability to assess technology and make wise judgments when integrating it to enhance student learning (Cennamo et al., 2019). The utilization of technological tools and gadgets in group work, together with the integration of technology into English language instruction, promoted a collaborative approach to problem-solving and comprehension. Through increased participation in corpus linguistic study, this interaction raised students' interest in and active involvement in learning English as a foreign language (Cyfeku & Noli, 2022). If educators possess excellent technological skills, they can effectively incorporate technology into their lesson plans. Moreover, access to technology resources is necessary for integrating it into the classroom, particularly in certain countries. Therefore, a lack of expertise in efficient teaching strategies hinders the adoption of technology for learning objectives (2018 Ammade et al). By incorporating technology into their English education, they can learn on their own much better (Nur Hafezah Hussein et al., 2018).

With a focus on improving language proficiency, motivation, and cultural awareness, this systematic study offers a thorough investigation of the efficacy of technology integration in English language learning. Even though technology has many advantages, some issues need to be addressed, such as students who spend too much time learning how to use it instead of using it for learning (Liang, 2021). In addition, the research underscores how crucial it is for educators and students to have thorough training in addition to internet connection to fully reap the rewards of technological integration. The study also highlights the significance of customized methods to technology integration by illuminating the various demands and learning styles of students (Elsakova et al., 2019). Technology can support interactive and engaging learning experiences, as demonstrated by the active participation of students in corpus linguistic studies and the facilitation of collaboration through technological tools (Cyfeku & Noli, 2022). Nonetheless,
educators’ technological competence and resource availability are critical to the effective integration of technology, underscoring the necessity of continued professional development and fair access to technology (Ammade et al., 2018). In summary, the present discourse highlights the potential of technology to revolutionize English language instruction. However, it also emphasizes the necessity of tackling obstacles and implementing tailored, tactical methods to optimize its advantages for language learners.

3.3. Digital Resources in Technology-Enhanced English Language Instruction

Whatever people may think about technology, we now must acknowledge that modern society must use technology in education; otherwise, we risk falling behind (Rintaningrum R, 2023). While the search results may not explicitly address it, this literature review acknowledges the pivotal role of digital resources in technology-enhanced English language instruction. By examining the integration of digital texts, eBooks, and language learning software into instructional practices, this study underscores the potential of technology to supplement traditional print resources and create dynamic learning environments. Through an analysis of existing literature, this review elucidates the diverse range of digital tools available to educators and highlights their impact on student engagement, autonomy, and digital literacy skills. By synthesizing empirical findings and theoretical perspectives, this study offers insights into the integration of digital resources into English language instruction and its implications for pedagogical practice.

The degree of ICT integration reflects the teacher's ability to incorporate ICT into the classroom; according to Dwiono et al (2018), the instructor is only thought to be able to use fundamental functions in a small number of computer applications with little to no modification or development. Despite efforts to promote technology use in the classroom, educators face challenges such as teachers' lack of confidence while using computer-assisted language learning (CALL) tools and concerns about becoming uncontrollable. They usually stick to tried-and-true methods of instruction, only accessing online resources that enhance their present workflow (Wang, 2021). Contrarily, research indicates that technology fosters communicative interactions between educators and students, generates understandable input and output, aids in the development of student's critical thinking skills, increases student autonomy and comfort, and increases students' willingness to successfully learn a foreign language (Syathroh et al., 2021). This study revealed no significant correlation between the age of teachers and the use of technology in the classroom.

However, the research did find a strong association between the value teachers placed on technology, their levels of competency with it, and the use of it in Saudi EFL sessions. To improve this integration, it is suggested that educators receive support and training in the use of technology. Classrooms should also have technology, such as laptops and smartboards, to facilitate this integration (Almalki, 2020). Children who utilize technology can learn more, become more fluent in English, and be encouraged to be independent and creative. Anyone wishing to do similar national and international studies might use these as a resource. However, it is crucial to remember that while the use of technology is meant to improve learning outcomes and instructional efficacy, this study's evaluation of these effects is limited (Wahyuni et al., 2020). A useful tactic for piquing students' interest in learning is multimedia training, which raises motivation and interest in the subject matter. A primary goal of effective English language teaching (ELT) should be to make instructional materials and information easily accessible. Multimedia technology can enhance ELT courses when teachers are adept at using computers. Additionally, it can assist educators in
getting beyond financial obstacles to installing the necessary infrastructure and stop them from being reluctant to employ technology. (Joshi & Pandya, 2022).

This analysis of the research highlights how essential technology is to contemporary education and how important a role it plays in improving English language training. The study emphasizes the transformative potential of digital resources in language acquisition by recognizing the necessity of using technology in educational practices to prevent falling behind in today's interconnected world. The research highlights how digital texts, eBooks, and language learning software can enhance traditional print resources and establish dynamic learning environments that promote student engagement, self-sufficiency, and digital literacy abilities. Research indicates that technology fosters communicative interactions between educators and students, enhances critical thinking skills, and promotes student autonomy in language learning, despite the challenges educators face in integrating technology, such as a lack of confidence in using computer-assisted language learning tools and concerns about maintaining control in the classroom (Syathroh et al., 2021). The study emphasizes the significance of giving educators support and training to successfully incorporate technology into English language instruction, even while it finds no discernible relationship between teachers' age and technology use (Almalki, 2020). In addition, the review highlights how multimedia technology can improve English language training by facilitating easy access to instructional resources and igniting students' interest and motivation (Joshi & Pandya, 2022). In summary, this section highlights how crucial it is to strategically use technology in English language training in order to maximize learning results and get students ready for success in the digital age.

3.4. Technology-Enabled Assessment in English Language Instruction

In investigating technology integration into English language instruction, this systematic literature review also explores its application in assessment practices. While the tasks/assessment must inspire students to achieve a final objective, the process itself is more important than the objective (MAVILI, S., & KARTAL, G., 2022). By examining the use of computer-adaptive testing systems, automated grading tools, and online assessment platforms, this study sheds light on how technology is reshaping assessment practices in language instruction. Furthermore, it highlights the potential of technology-enabled assessments to provide timely feedback, track student progress, and inform instructional decision-making. Through a synthesis of empirical research and theoretical frameworks, this review offers insights into the opportunities and challenges associated with technology-enabled assessment in English language instruction, paving the way for future research and practice in this rapidly evolving field.

The results of this study support earlier research in technology-enhanced/mediated TBLT, which implicates the appropriate use of technology affordances to create a meaning-focused language classroom with target structure repetition and learner needs and interests considered (Mavili & Kartal, 2022). Students can use electronic portfolios to record their learning experiences, development, and successes throughout their academic careers. The Electronic Portfolio Platform (EPP) serves as a virtual repository for students to keep finished written assignments together with information about their experiences, successes, and personal development. Students can exhibit their language skills and knowledge using e-portfolios, which also allow them to participate in self-assessment and self-direction that highlights the process rather than the product of their educational journey (Dr. Tribhuwan Kumar et al., 2022). Assessing young students presents inherent challenges, particularly when technology is involved; Student-related obstacles include age-related limitations on their capacity to use technology on their own
and socioeconomic problems specific to the field of study (Bavlı, B & Ağaoğlu, A 2023). The practice analysis showed that, even in the context of a traditional curriculum, proficient teachers struggle to attain deep technological integration and to deploy cutting-edge, technology-driven teaching practices. This analysis considers the practical implications, teacher preparation, policy implications, and future research fields (Bereczki & Kárpáti, 2021).

This section examines the ways in which technology is influencing English language instruction and assessment. It examines electronic portfolios and online assessments, among other things. These resources enable teachers to assess students' performance and provide prompt feedback. But there are difficulties, particularly when it comes to younger pupils who can find it difficult to use technology. More assistance is also required for teachers to use these technologies efficiently. Ultimately, even though technology has numerous advantages, there are still certain challenges when it comes to using it for English language instruction and assessment.

4. CONCLUSION
In conclusion, this thorough analysis highlights the growing importance of technology in education, especially when it comes to language learning, as it encourages student participation, speeds up instruction, and accommodates learners who are accustomed to using digital devices. It also highlights the difficulties instructors have incorporating technology into their teaching, underscoring the need for further professional development and assistance. The analysis also emphasizes how crucial it is to match learning objectives and technological integration methodologies in order to maximize results, provide sufficient funding, and provide thorough training. It promotes an all-encompassing strategy in which technology advances learning without taking precedence over academic objectives. It also looks at how instructors' unease with technology might be overcome to build dynamic learning environments with digital resources. Lastly, it explores the consequences of technology-enabled evaluation techniques, addressing possible disadvantages like age-related limits and socioeconomic disparities while also noting advantages like instant feedback. Ultimately, for technology integration in English language instruction to be successful, careful planning, ongoing support, and a pedagogically driven approach are essential. This allows teachers to take advantage of technology's transformative potential for better learning outcomes and lively, engaging classrooms.
